Product Overview

Self-Aligning Linear Bushing

- High load Capacity and long travel life
- Interchangeable with Standard linear bushing on European&American Type
- Travel speeds up to 10ft/s (3m/s) and smooth operation
- Easy of installation as a result of self-aligning Ball plates (±0.5˚)
- Anti-Rusting: Nickel or Chrome Plating, Raydent Treatment of ball plate,
  Stainless-steel ball Plate (Under LMES12, LMBS8),Stainless- steel ballLMES,
  LMES, LMES_OP: European Standard(㎜), p34~37
  LMBS, LMBS_OP: Amearican Standard(inch), p38~41

Compact Linear Bushing

- Economic product used for variety of application
- Compact size resolving space restriction
- Ease of assembly : no need additional accessary
- Housing applicable for anti-rusting, etc
- 100% interchangeable : perfectly interchange with other companies'
  compact series
  CLB, p42~43

8

Product
Overview
Standard Linear Bushing

- Allowed Max. 10130N the basic dynamic load rating
- Shaft diameter from 5㎜ to 80㎜
- Provide low friction on high-speed movement
- Can be selected resin retainer (standard), and steel retainer (for high
  temperature & vacuum)
- Corrosion-resisting: the nickel-plated, Raydent treatment of Outer-
  sleeves,stainless steel ball
  LM, LM_OP, LM_AJ, LM_L：Asian standard, p62~69
  LME, LME_OP, LME_AJ, LME_L： European standard, p102~109
Flanged type Linear Bushing

- With a variety of design and ease of installation
- Used in case of passing the load of moving body directly to the Linear Bushing
- Installed without housing
- Can be selected resin retainer (standard), and steel retainer (for high
  temperature & vacuum)
- Corrosion-resisting: the nickel-plated, Raydent treatment of Outer-
  sleeves, stainless steel ball
  LMF_(L), LMK_(L), LMH_(L): Asian standard, p70~81
  LMEF_(L), LMEK_(L): European standard, p110~117

Pilot Flanged type Linear Bushing

- With a variety of design and ease of installation
- When the load of moving body passed directly to the Linear Bushing, the Pilot Flange can get more stable movement and being the most suitable for moment load
- Installed without housing
- Can be selected resin retainer (standard), and steel retainer (for high temperature & vacuum)
- Corrosion-resisting: the nickel-plated, Raydent treatment of Outer-sleeves, stainless steel ball

  LMFP_(L), LMKP_(L), LMHP_(L) : Asian standard, p82~93
  LMEFP_(L), LMEKP_(L) : European, p118~125

Middle Pilot Flanged type Linear Bushing

- With a variety of design and ease of installation
- When the load of moving body passed directly to the Linear Bushing, the Pilot Flange can get more stable movement and being the most suitable for moment load on both sides of the moving body
- Installed without housing
- Can be selected resin retainer (standard), and steel retainer (for high temperature & vacuum)
- Corrosion-resisting: the nickel-plated, Raydent treatment of Outer-sleeves, stainless steel ball

  LMFM, LMKM, LMHM: Asian standard, p94~99
  LMEFM, LMEKM: European standard, p126~129

Aluminum Case Unit

- Combination product with Aluminum housing and standard or Self-Aligning linear bushing
- Aluminum housing with high precision and lightweight
- Abnormal variant does not occur within reasonable load
- Minimized surface scratch

  SC, SC_V, SC-W, SCJ: Asian standard, p132~141
  SCE, SCE_V, SCE_W: European standard, p146~151

Aluminum Case Unit (Open Type)

- Integration of open type aluminum housing and open type linear bushing
- Aluminum housing with a high hardness and lightweight
- Combined with support rail

  SBR, TBR: Asian standard, p142~145

9

Product
Overview

SUS SERIES-Linear Bushing

- Outer-sleeve and ball : used stainless steel, corrosion-resistance products
- Can be selected LM Shaft diameter 5~25㎜
- Can be selected resin retainer (standard), and steel retainer (for high temperature & vacuum) (LM5, LM8S resin retainer only)

LM, LM_AJ, LM_(L) : Asian standard, p154~161
LME, LME_AJ, LME_(L) : European standard, p194~201

SUS SERIES-Flanged Linear Bushing

- Outer-sleeve, ball and flange : used stainless steel. corrosion-resistance products
- With a variety of design and ease of installation
- Used when the load of moving body passed directly to the Linear Bushing
- Installed without housing
- Can be selected resin retainer (standard), and steel retainer (for high temperature & vacuum)

LMF_(L), LMK_(L), LMH_(L) : Asian standard, p162~173
LMEF_(L), LMEK_(L) : European standard, p202~209

SUS SERIES-Pilot Flanged Linear Bushing

- Outer-sleeve, ball and flange : used stainless steel, corrosion-resistance products
- With Variety of design and ease of installation
- When the load of moving body passed directly to the Linear Bushing, the Pilot Flange can get more stable movement and being the most suitable for moment load
- Installed without housing
- Can be selected resin retainer (standard), and steel retainer (for high temperature & vacuum)

LMFP_(L), LMKP_(L), LMHP_(L): Asian standard, p174~185
LMEFP_(L), LMEKP_(L): European standard, p210~217

SUS SERIES-Middle Pilot Flanged type Linear Bushing

- Outer-sleeve, ball and flange: used stainless steel, corrosion-resistance products
- With a Variety of design and ease of installation
- When the load of moving body passed directly to the Linear Bushing, can get more stable movement for moment load
- Installed without housing
- Can be selected resin retainer (standard), and steel retainer (for high temperature & vacuum)

LMFM, LMKM, LMHM : Asian standard, p186~191
LMEFM, LMEKM : European standard, p218~221

Support Rail Unit

- Integration of aluminum rail and shaft
- Combined with open type Aluminum Case Unit
  SBS, TBS: Asian, European standard, p248~249, p250~251

LM Shaft / Shaft Support

- High carbon bearing steel shaft (surface treatment and chamfering is possible)
- Corrosion-resisting: Stainless steel LM Shaft
- Aluminum shaft support
  SK : Shaft support, Asian, European standard, p252~253
  SF : LM Shaft, Asian, European standard, p254~255

Technical Information

Load Rating and Service Life of Linear Motion System

When determine a model that would best suit for service conditions of a linear motion system, the load rating and travel life of the model must be considered. To consider the load rating, you should know the static safety factor of the model, which is calculated based on the basic static load rating. The service life can be assessed by calculating the nominal life, based on the basic dynamic load rating, and you need to check if the values thus obtained meet your requirements.

Basic static load rating

There are two basic load ratings of a linear motion system: basic static load rating (C0), which sets the static load allowance limit, and basic dynamic load rating(C), which is using for calculating travel life.

Basic Static Load Rating (C$_0$)

If a linear motion system, whether at rest or in motion, receives an excessive load or large impact, a local permanent deformation develops the raceway and rolling elements. And if the magnitude of the permanent deformation exceeds a certain limit, it hinders the smooth motion of the linear motion system. The basic static load rating refers to a static load in a given direction with given magnitude, which total permanent deformation of rolling elements and raceway at the contact area is approximately 0.0001 of the rolling element diameter. In a linear motion system, the basic static load rating is defined as the radial load. Thus, the limit of static load allowance is the basic static load rating. For the rating values of individual linear motion systems, see the respective specification table in this catalog.

Static Safety Factor (f$_s$)

A linear motion system may possibly receive an unpredictable external force due to the vibration or impact while it is at rest or in motion, or inertia as a result of starting and stopping. It is, therefore, necessary to consider the static safety factor against operating loads. The static safety factor(fs) indicates the ratio of a linear motion system load carrying capacity (basic static load rating, C0) to the load exerted there on. To calculate a load exerted on the linear motion system, the mean load for calculating the service life and the maximum load for calculating the static safety factor must be obtained in advance. A system can receive unexpected excessive load when it is subject to frequent starts and stops, placed under machining loads, or when the severe moment is applied by overhanging loads. When selecting the correct type of a linear motion system for your application, be sure that the type you are considering can bear the maximum possible load when stopped and in operation. The table below specifies the standard values for the static safety factors.

$$f_s = \frac{C_0}{P} \quad \text{또는} \quad f_s = \frac{M_0}{M}$$

f$_s$	: Static safety factor	
C$_0$	: Basic static load rating	(N)
M$_0$	: Static permissible moment	(N·mm)
P	: Calculated load	(N)
M	: Calculated moment	(N·mm)

To calculate a load exerted on the linear motion system, the mean load for calculating the service life and the maximum load for calculating the static safety factor must be obtained in advance. A system can receive unexpected excessive load when it is subject to frequent starts and stops, placed under machining loads, or when the severe moment is applied by overhanging loads. When selecting the correct type of a linear motion system for your application, be sure that the type you are considering can bear the maximum possible load when stopped and in operation. The table below specifies the standard values for the static safety factors.

Fig 1. Static Safety Factor(f_s)

Machine used	Loading conditions		fs lower limit
Ordinary Industrial Machine	Receives no vibration or impact		$1.0 \sim 1.3$
	Receives vibration or impact		$2.0 \sim 3.0$
Machine tool	Receives no vibration or impact		$1.0 \sim 1.5$
	Receives vibration or impact		$2.5 \sim 7.0$

For large radial loads	$\dfrac{f_H \cdot f_T \cdot f_C \cdot C_0}{P} \geq f_s$

C_0 : Basic static load rating (N)	P : Calculated load (N)	f_H : Hardness factor
f_T : Hardness factor	f_C : Temperature factor	

Basic Dynamic Load Rating(C)

The basic dynamic load rating (C) refers to a load in a given direction with given magnitude such that when identical linear motion systems in a group are interlocked with one another under the same conditions, the nominal life (L) of the systems is 50㎞ (L=50㎞) if the systems use balls, and 100㎞(L=100㎞) if they use rollers. The basic dynamic load rating (C) is used to calculate the service life of a set of linear motion systems, which are interlocked with one another in response to a load. For rating values of individual linear motion systems, see the respective specification tables in this catalog.

Nominal Life

The service lives of linear motion systems more or less vary from system to system even if they are manufactured to the same specifications and remain in service under the same operating conditions. Hence a guideline for determining the service life of a linear motion system is given based on nominal life, Which is defined as follows. The nominal life refers to the total running distance that 90% of identical linear motion systems in a group, when interlocked with one another under the same conditions, can achieve without flaking develops. The nominal life (L) of a linear motion system can be obtained from the basic dynamic load rating (C)and load imposed (P) using the following equations.

For linear motion system with balls	For a linear motion system with rollers
$L = \left(\dfrac{C}{P}\right)^3 \times 50$	$L = \left(\dfrac{C}{P}\right)^{\frac{10}{3}} \times 100$
$L_{100} = \left(\dfrac{C_{100}}{P}\right)^3 \times 100$	
$※ C_{100} = \left(\dfrac{C}{1.26}\right)$	
L : Nominal life of 50㎞	L : Nominal life of 100㎞
L_{100} : Nominal life of 100㎞	
C : Basic dynamic load rating of 50㎞	
C_{100} : Basic dynamic load rating of 100㎞	
P : Applied load	

The travel life of the Linear Bushing can be obtained using the following equation

$$L = \left(\frac{f_H \times f_T \times f_c}{f_w} \times \frac{C}{P} \right)^3 \times 50$$

$$L_{100} = \left(\frac{f_H \times f_T \times f_c}{f_w} \times \frac{C_{100}}{P} \right)^3 \times 100$$

L : Nominal life of 50km L_{100} : Nominal life of 100km
C : Basic dynamic load rating of 50km
C_{100} : Basic dynamic load rating of 100km
P : Applied load f_H : Hardness factor (see Fig 1)
f_T : Temperature (see Fig 2) f_c : Contact factor (see Table)
f_w : Load factor (see Table)

Once nominal life L is obtained using this equation, the Linear Bushing service life can be calculated using the following equation, if the stroke length and the number of reciprocating cycles are constant

$$L_h = \frac{L \times 10^6}{2 \times \ell_s \times N_\ell \times 60}$$

L_h : Travel life in hours ℓ_s : Stroke
N_ℓ : Number of strokes per minute

Factors that affect the travel life

Hardness factor(f_H)

To ensure achievement of the optimum load rating of the LinearBushing, the raceway hardness must be 58 to 64 HRC. Athardness below this range, the basic dynamic and static loadratings decrease. The ratings must therefore be multiplied by therespective hardness factors (f_H).

a Raceway Hardness(H_RC)
Fig1 Hardness factor(f_H)

a Raceway temperature(°C)
Fig2 Temperature factor(f_T)

Temperature factor(f_T)

For Linear Bushings used at ambient temperaturesover 100°C, a temperature factor corresponding tothe ambient temperature, selected from the diagram, must be taken into consideration. For higher than 80°C application, the seals, end plates, and retainer must be changed for high temperature specifications. (Temperature range: `20°C ~ 80°C)In addition, please note that the selected Linear Bushing itself must be a model with high temperature specifications.

Contact factor(f$_c$)

When multiple Linear Bushings are used laid over one another, moments and mounting-surface precision will affect operation, making it difficult to achieve uniform load distribution. For Linear Bushings used laid over one another, multiply the basic load rating (C or C0) by a contact factor selected from the table below.

Fig 2. Contact factor(f$_c$)

Number of linear bushings on a shaft	Contact factor(fC)(f$_c$)
2 3 4 5 Over 6	0.81 0.72 0.66 0.61 0.60
In normal use	**1.0**

Load factor(f$_w$)

In general, machines in reciprocal motion are likely to cause vibration and impact during operation, and it is particularly difficult to determine the magnitude of vibration that develops during high-speed operation, as well as that of impact during repeated starting and stopping in normal use. Therefore, where the effects of speed and vibration are estimated to be significant, divide the basic dynamic load rating (C) by a load factor selected from the table below.

Fig 3. Load factor(f$_w$)

Operating conditions		Load factor (f$_w$)
Load conditions	Speed	
No impact and vibration	Under 15m/min	1.0~1.5
Sight impact and vibration	Under 60m/min	1.5~2.0
considerable impact and vibration	Over 60m/min	2.0~4.0

Load Consideration

When designing a linear motion system, it is necessary to consider how the variables of operation will affect performance. The following examples demonstrate how the position of the load and the center of gravity can influence the product selection. When evaluating your application, review each of the forces acting on your system and determine the product best for your needs.

Horizontal Application | At the time of movement with uniform velocity or at the time of stop

$$F_{1Z} = \frac{W}{4} + (\frac{W}{2} \cdot \frac{d_2}{d_0}) - (\frac{W}{2} \cdot \frac{d_3}{d_1})$$

$$F_{2Z} = \frac{W}{4} - (\frac{W}{2} \cdot \frac{d_2}{d_0}) - (\frac{W}{2} \cdot \frac{d_3}{d_1})$$

$$F_{3Z} = \frac{W}{4} - (\frac{W}{2} \cdot \frac{d_2}{d_0}) + (\frac{W}{2} \cdot \frac{d_3}{d_1})$$

$$F_{4Z} = \frac{W}{4} + (\frac{W}{2} \cdot \frac{d_2}{d_0}) + (\frac{W}{2} \cdot \frac{d_3}{d_1})$$
Horizontal Application | At the time of movement with uniform velocity or at the time of stop

$$F_{1Z} = \frac{W}{4} + (\frac{W}{2} \cdot \frac{d_2}{d_0}) - (\frac{W}{2} \cdot \frac{d_3}{d_1})$$

$$F_{2Z} = \frac{W}{4} - (\frac{W}{2} \cdot \frac{d_2}{d_0}) - (\frac{W}{2} \cdot \frac{d_3}{d_1})$$

$$F_{3Z} = \frac{W}{4} - (\frac{W}{2} \cdot \frac{d_2}{d_0}) + (\frac{W}{2} \cdot \frac{d_3}{d_1})$$

$$F_{4Z} = \frac{W}{4} + (\frac{W}{2} \cdot \frac{d_2}{d_0}) + (\frac{W}{2} \cdot \frac{d_3}{d_1})$$
Side Mounted Application | At the time of movement with uniform velocity or at the time of stop

$$F_{1Y} \sim F_{4Y} = (\frac{W}{2} \cdot \frac{d_3}{d_0})$$

$$F_{1Z} = F_{4Z} = \frac{W}{4} + (\frac{W}{2} \cdot \frac{d_2}{d_0})$$

$$F_{2Z} = F_{3Z} = \frac{W}{4} - (\frac{W}{2} \cdot \frac{d_2}{d_0})$$
Vertical Application | At the time of movement with uniform velocity or at the time of stop
At the time of start and stop, the load varies because of inertia

$$F_{1X} \sim F_{4X} = (\frac{W}{2} \cdot \frac{d_2}{d_0})$$

$$F_{1Y} \sim F_{4Y} = (\frac{W}{2} \cdot \frac{d_3}{d_0})$$

$$F_{1X + 4X} \sim F_{2X + 3X}$$

$$F_{1Y + 4Y} \sim F_{2Y + 3Y}$$
Technical terms：d₀ = distance of Case units' center line   d₁ = distance LM shaft's center line
               d₂ = distance between carrier's center line and load point   d₃ = distance between carrier's center line and load point
               W = Weight(N) F_{NX} = X-axial force(N) F_{NY} = Y-axial force(N) F_{NZ} = Z-axial force(N)

⬤ Mean Effective Load at Varying Load

The load acting on a linear system changes depending on the application, for example, when the linear system starts or stops reciprocating motion, while it is operating at a fixed speed, and according to whether the linear system carries work or not. For a fluctuating load, it is important to obtain the mean effective load.

For stepped load according to the travelling distance

$$P_m = \sqrt[3]{\frac{1}{L}\left(P_1^3 \cdot L_1 + P_2^3 \cdot L_2 \dots + P_n^3 \cdot L_n\right)} \quad \dots\dots\dots (1)$$

P_m : mean effective load in fluctuation (N)
P_n : floating load (N)
L : Total traveling distance (mm)
L_n : Traveling distance with carrying Pn (mm)

(1)
For loads that changes step wisely

For almost linearly varying load

$$P_m \fallingdotseq \frac{1}{3}\left(P_{min} + 2 \cdot P_{max}\right) \quad \dots\dots\dots\dots\dots\dots (2)$$

P_m : mean effective load in fluctuation (N)
P_{min} : Minimum value of fluctuating load (N)
P_{max} : Maximum value of fluctuating load (N)

(2)
For loads that changes monotonously

When the load draws a sine curve

$$P_m \fallingdotseq 0.65\, P_{max} \quad \dots\dots\dots\dots\dots (3)$$
$$P_m \fallingdotseq 0.75\, P_{max} \quad \dots\dots\dots\dots\dots (4)$$

(3)

(4)
For loads that changes sinusoid ally

27

Self-Aligning Linear Bushing(LMES, LMBS)

⬤ High Capacity Self-Aligning Linear Bushing - SUPERBALL

Higher Load Ratings and Travel Life

Specially designed ball plate is made of Hardened steel, and the precisely ground groove is slightly larger than the ball size, which provides greater contact area between the ball and the ball plate. In addition, this design provides 3 times higher load ratings and 27 times longer travel life compared to conventional Linear Bushing.

Self-Alignment

Ball plate has a convex shape to provide a pivot point at the center, which allows Self Alignment up to 0°.5. This Self Alignment capability eliminates any possibility of edge pressure caused by inaccurate machining, errors on mounting, or shaft deflection. Moreover, it obtains uniform load distribution and low friction motion.

Smooth and Silent Running

SUPERBALL has extremely smooth running due to the uniquely designed ball retainer and the outer sleeve. They are made of Engineering Polymer, which has light weight, low friction, and high wear-resistance. Due to them, the smooth and silent running can be obtained..

Clearance Adjustment

SUPERBALL's ball plates are designed to float in the outer sleeve. This allows clearance between the balls and shaft to be adjusted for the best application environment by using with the housing.

Interchangeability

SUPERBALL is designed to be fully Interchangeable with conventional linear bushing.
Fig3. Cross-section of SUPERBALL

Ball Plate
Fig4. SUPERBALL's self-alignment feature

1°

⬤ Cost Effectiveness

Lower cost on installation

Self-Alignment feature can compensate the inaccurate machining of the base, so less installation time and cost can be obtained.

Higher load rating and longer travel life

Compared to the same size conventional linear bushings, SUPPERBALL will offer higher load rating and longer travel life.
Reduction of material cost

SUPERBALL's higher load rating enables the use of smaller components, and reducing material cost.

STANDARD SUPER BALL

Energy saving

SUPERBALL is designed with lightweight, lower inertia, and low friction, so it enables the moving parts to have rapid motion with lower driving power.

⬤ Load Ratings and Travel Life

SUPERBALL's load ratings give an influence to travel life with load direction, ball circuit orientation, and hardness of the shaft.

	Orientation of Balls		
No. of Ball Row	4 Row	5 Row	6 Row
Max. Load			
Equation	$F = 1.41 \times C$	$F = 1.46 \times C$	$F = 1.26 \times C$
Min. Load			
Equation	$F = C$	$F = C$	$F = C$

Basic Dynamic load rating(C) and travel life

The travel life of a Linear Bushing is determined largely by the quality of the shaft. The Basic Dynamic load rating is maximum continuous load that can be applied to the Linear Bushing with 90% of reliability achieving after 50㎞ operation under normal conditions. The nominal travel life can be calculated by follow equation.

$$L = [\frac{C}{P}]^3 \times 50$$

$$L_{100} = [\frac{C_{100}}{P}]^3 \times 100$$

L : Nominal life (basis 50㎞, unit : ㎞)
L_{100} : Nominal life (basis 100㎞, unit : ㎞)
C : Basic dynamic load rating (basis : 50㎞, unit : N)
C_{100} : Basic dynamic load rating (basis : 100㎞, unit : N)
P : Applied load

Practically, other factors will affect the life as follows

$$L = [\frac{f_H \times f_T \times f_c}{f_w} \times \frac{C}{P}]^3 \times 50$$

$$L_{100} = [\frac{f_H \times f_T \times f_c}{f_w} \times \frac{C_{100}}{P}]^3 \times 100$$

f_w : Load factor
f_H : Hardness factor
f_T : Temperature factor
f_c : Contact factor

From the above equations, the stroke and frequency are constant, the Travel Life can be calculated by following equation

$$L_h = \frac{L \times 10^6}{2 \times \ell_s \times N_\ell \times 60}$$

L_h : Travel life(hour)
ℓ_s : Stroke(mm)
N_ℓ : Number of strokes per minute(cpm)

⬤ Examples of Calculation and Choosing a proper SUPERBALL

The Maximum applied load and the travel life are the most important factor for choosing a proper Linear Bushing size. Below are the sample calculation of the expecting travel life and choosing of proper Linear Bushing size.

< Working conditions >

- Applied load	: 250N (P)	- Stroke	: 250mm (ℓ_s)
- Number of strokes per minutes	: 60 (N_ℓ)	- Shaft Hardness	: H_RC60 ($f_H = 1.0$)
- Operating speed	: 30m/min		

Operating Speed V = 2× ℓ_s ×N_ℓ
               = 2×250×60
               = 30,000mm/min ($f_w = 1.6$)
Other factors (f_c, f_T) are considered as 1.0

Calculation of expected travel life

Since, basic dynamic load rating is based on travel life of 50㎞ and assuming all other factors as 1.0, you can choose the Linear Bushing size that you can expected Travel life. Let's try LMES20UU with the above working conditions.

$$L = [\frac{1.0 \times 1.0 \times 1.0}{1.6} \times \frac{2,580}{250}]^3 \times 50$$
$$\fallingdotseq 13,417 \text{ km}$$

$$L_h = \frac{13,417 \times 10^6}{2 \times 250 \times 60 \times 60}$$
$$\fallingdotseq 7,454 \text{ hours}$$

Choosing proper Linear Bushing

Let's assume our design travel life is 15,000hours,

$$L = 15,000 \times 2 \times 250 \times 10^{-6} \times 60 \times 60 = 27,000 \text{km}$$
$$C = \frac{250 \times 1.6}{1.0 \times 1.0 \times 1.0} \times \sqrt[3]{\frac{27,000}{50}} = 3,257 \text{N}$$

Therefore, the proper SUPERBALL for above condition is LMES25UU which has 3800N as the Basic dynamic load rating.

⭕ Housing and Shaft

Housing

For SUPERBALL's application, Housing is required. Tolerance of Housing bore will affect the life and the accuracy of application. See the below Table However, if the tolerance of housing is H7, tight fitting can be occurred at both ends of outer- sleeves in case of LMES type

Table9. Housing and tight fitting

Part number(㎜)	LMES10	LMES12	LMES16	LMES20	LMES25	LMES30	LMES40	LMES50

LM Shaft

Because the balls in SAMICK SUPERBALL as rolling elements are running directly on the shaft surface, the hardness, surface finish, and tolerance of shaft will largely affect on the traveling performance of SUPERBALL. The shaft must be manufactured with following conditions;

1) Hardness
The hardness must be HRC 58 to 64. The shaft with hardness less than HRC58 will lead decreasing of travel life and permissible load.

2) Surface Finishing
The surface finishing must be 1.6S or better for smooth operation.

3) Tolerance
The correct tolerance of the shaft diameter is recommended. See the below table.

Table10. Shaft and tight fitting

SAMICK Linear Bushing

⬤ SAMICK LINEAR BUSHING

SAMICK Linear Bushing, LM type is the linear motion system with unlimited stroke by applying with LM shaft. Because of the point contact between Balls and LM shaft, minimum friction can be acquired and that can give you the high precision motion. SAMICK Linear Bushing serves the alignment of the balls toward the LM Shaft by the single Retainer and cylindrical shape of Raceway. Outer Sleeve is made of high-carbon Chromium Bearing Steel, and inner and outer grinding processes are applied after Heat treatment.

Interchangeability

The Dimensions of SAMICK Linear Bushing are standardized to have full interchangeability. LM shaft is provided with the cylindrical grinding to have high precision fitting clearance.

Rigid Outer Sleeve

Hardened and Precisely ground Outer Sleeve is made of Bearing steel, and can be direct assembled with the needle bearing on outer surface.

High precision Retainer

The single body retainer guides 4~6 ball circuits, and it makes the precision guiding against the balls moving direction and smooth motion.

LM Case Unit

LM Case Unit, SC type is consist of the light Aluminum case and LM type Linear Bushing, so the assembly can be finished by simple bolting. Longer life can be obtained by adjusting the Ball circuit orientation of Linear Bushing against the direction of load.

Application

SAMICK Linear Bushing are widely used in Precision equipments; Computer and peripheral equipments, Measuring equipments, Auto recording equipments, and 3D measuring equipments, and Linear Motion systems in Machine for Mass Production; Multi-Axis Drilling machines, Punching Press, Tool Grinders, Auto-Gas cutters, printing machines, card selectors, food packing machines, and etc.

⬤ Structure

⬤ Load rating and Travel Life

The Load rating of SAMICK Linear Bushing can be affected by the balls orientation against the Load. The Basic Load rating in the table is the Load rating of Linear Bushing when 1 (one) Ball circuit are just beneath the load. As shown in Table, If the Ball are located on symmetrical position against the Load, the Load rating will be increased and the travel life will be extended.

Load ratings and Orientation of Balls

No. of Ball Row	Orientation of Balls		
	4 Row	5 Row	6 Row
Max. Load			
Equation	F = C	F = C	F = C
Min. Load			
Equation	F = 1.41 × C	F = 1.46 × C	F = 1.26 × C

Basic Dynamic load rating(C) and travel life

The travel life of a Linear Bushing is determined largely by the quality of the shaft. The Basic Dynamic load rating is maximum continuous load that can be applied to the Linear Bushing with 90% of reliability achieving after 50㎞ traveling under normal conditions. The nominal travel life can be calculated by follow equation.

$$L = [\frac{C}{P}]^3 \times 50$$

$$L_{100} = [\frac{C_{100}}{P}]^3 \times 100$$

L : Nominal life (basis:50km, unit: ㎞)
L_{100} : Nominal life (basis:50km, unit: ㎞)
C : Basic dynamic load rating(basis:50km, unit: N)
C_{100} : Basic dynamic load rating(basis:10km, unit: N)
P : Applied load

Practically, other factors (Hardness factor, Load factor, Contact factor, etc) will affect the life as follows.

$$L = [\frac{f_H \times f_T \times f_c}{f_w} \times \frac{C}{P}]^3 \times 50$$

$$L_{100} = [\frac{f_H \times f_T \times f_c}{f_w} \times \frac{C_{100}}{P}]^3 \times 100$$

f_w : Load factor
f_H : Hardness factor
f_T : Temperature factor
f_c : Contact factor

Contact use of Linear Bushing and Travel life

Contact use with one or two Outer-sleeves and calculate equivalent radial load in case of moment load

$$P_U \fallingdotseq K \cdot M$$

P_U : Equivalent radial load (N)
(load by moment load)
K : Equivalent coefficient (see Table 6)
M : Moment (N·mm))

From the above equation, the stroke and frequency are constant, the Travel Life can be calculated by following equation.

$$L_h = \frac{L \times 10^6}{2 \times \ell_s \times N_\ell \times 60}$$

L_h : Travel life (hr)
ℓ_s : Stroke (mm)
N_ℓ : Number of strokes per minute (cpm)

Table 6. Linear Bushing Equivalent coefficient

★3 Equivalent coefficient of LMEF/K/H, SCE type is same as LME type

Short stroke Applications

In applications when the stroke is short, the life of the shaft is shorter than that of the Linear Bushing. In short stroke applications, the required dynamic load rating must be multiplied by the shot stroke correction factor (K_C) found on Fig right side.

Fig 5. Short stroke correction factor(KC)
Lubrication and Friction

Linear Bushing is used with grease lubrication or oil lubrication but in some case, it is used without any lubrication.

Grease Lubrication

Before applying the grease, the anticorrosive oil must be removed by kerosene or organic solvent, and applying the grease after drying. Must Applying grease directly on the ball for both side sealed type (UU), and applying same as above or applying on the shaft for without sealed type. Lithium soap radical of viscosity mark (JIS No. 2) is recommended for use.

Oil Lubrication

사용온도 범위	점도(Viscosity)
-30°C ~ 50°C	VG 15 ~ 46
50°C ~ 80°C	VG 46 ~ 100
Fig 6

There is no need to remove anticorrosive oil when oil is used for lubrication. ISO viscosity grade VG15~100 oil is usually used according to the temperature. The turbine oil, machine oil, and spindle oil are usually used as lubrication oil.

Drop the oil on the shaft for lubrication, or supply it through an oil hole provided on the housing (Fig 6). However, dropping lubrication is not used in both seal type because the seal remove oil, because. Contact SAMICK for Linear Bushing with lubrication hole for user's demands

Coefficient of Friction

Linear Bushing has balls as rolling elements, so it gives rise to reduces the frictional resistance. Static friction in particular, is very low, and there is just little difference between static and dynamic friction, so, that stick-slip does not occur. Such low friction makes submicron feeding possible. The normal friction coefficient is on Fig below, and the Friction resistance can be calculated by following equation

$$F = \mu \cdot P + f_s$$

F   : Friction resistance force
f_s : Resistant of Seal (0.3 ~ 2.4N)
P   : Applied External load(Perpendicular Load against shaft core)(N)
μ : Friction Coefficient(Static or Dynamic)

Coefficient of Kinetic Friction
Fig 7. Coefficient of Kinetic Friction

⬤ Installation Guide

Tolerance of Housing bore

Recommended Tolerance of Housing bore for SAMICK Linear Bushing are in Table. Normal fit is standard, but for without clearance, pressed fit is also available.

Table 7. The bore clearance of Housing

Type		Case	
Part number	Grade	Normal fit	Pressed fit
LM	Higher(H)	H7	J7
LME	-	H7	K6, J6
LMF / FP LMK / KP LMH / HP LM _ L LMF / FP _ L LMK / KP _ L LMH / HP _ L LMFM	-	H7	J7

Clearance of Outer sleeve and Shaft

Normal fit is standard for using of Linear Bushing with LM shaft. And, for without clearance, tight fit is available. Next table shows outer diameter tolerance of shaft.

Table 8. Outer diameter tolerance of shaft

Type		LM Shaft	
Part number	Grade	Normal fit	Pressed fit
LM	Higher(H)	f6, g6	h6
LME	-	h7	K6
LMF / FP LMK / KP LMH / HP LM _ L LMF / FP _ L LMK / KP _ L LMH / HP _ L LMFM	-	f6, g6	h6

Negative diametric clearance should not exceed what is specified in the dimension table.

Radial Clearance																
Dr. Type	5	6	8S	8	10	12	13	16	20	25	30	35	40	50	60	80

LME(µm)	-5			-5		-7		-7	-9	-9	-9		-13	-13	-16	

Mounting

High holding strength toward LM shaft direction is not required, but just press fit only for mounting is not recommended..

Standard type

Feasible mounting methods are illustrated in Fig 8 and Fig 9. At this moment, fix the linear bushing with retaining rings and cover plates.
Fig 8. Mounting with retaining rings
Fig 9. Mounting with cover plates

Retaining ring for Mounting

Retaining ring for LM type SAMICK Linear Bushing are used for mounting as shown is the table below.

Table 9. Retaining ring dimension

Part number	Retaining ring(mm)			
	External (for Shaft)		Internal (for Bore)	
	C type	Needle type	C type	Needle type

LM 40	60	60	60	60
LM 50	80	80	80	80
LM 60	90	90	90	90
LM 80	120	120	120	120

★1 the information in the table is common for LM and LM-L type

Setscrew mounting prohibited

Mounting a Linear Bushing with a set screw as show in Figure will cause deformation of the outer sleeve and should be avoided.

**Fig 10.
Mounting with setscrew**

Housing　　　　Setscrew
Flanged type

Mounting for LMF, LMK, LMH (including long type), only mounting the flange with mounting bolt can be all of mounting because of its single body shape. Geometric Dimensional Tolerance should be considered when the Outer Sleeve is the datum for installation.

・**Mounting of Flange with mounting bolt**
・**Mounting with datum from an Outer diameter**
・**Mounting with datum from Outer Sleeve**
・**Mounting of Pilot flanged type**
・**Mounting of Middle flanged type**
Fig 11. Flanged type mounting

Mounting of Adjustable type

Adjustment of clearance for Adjustable type (AJ) and LM shaft can be obtained by assembling with the adjustable type Housing. In this case, the slotted side of Linear Bushing should be located at 90°of open side of Housing for equivalent deformation against radial direction..

Fig 12.
Mounting of adjustable type
Mounting of Housing

SAMICK Linear Bushing provides smooth movement designed with minimum frictional resistance. The advantage will not be effective without careful installation.

The most important thing is parallelization between Linear Bushing's alignment and LM shaft. Generally, two Linear Bushings are used at each LM shaft for smooth movement. Housing should be mounted by adjusting carefully as below. The process is unnecessary in case of SCW TYPE with two Linear Bushings. Also, the distance between housing's datum and LM shaft should keep parallel under 0.025㎜.

Inserting SPACE along the plane of housing where the bolt is fastened, It can be fastened with precise adjustment. Housing should be carefully mounted with parallelization as below.

Mounting datum plane
Fig 13.

Fig 14.

1) Install the mounting datum plane by setting the step pulley or assembly of a vertical support
2) Mount two housings cleavingly by the mounting datum plane.
3) Mount another pair of housings and fasten bolts at the opposite plane of Table.
4) Insert LM shaft with h6 or g6 of precise diameter and measure the distance between vertical support as 1) and LM shaft
5) Operate Table after fixing LM shaft and check the aligning
6) Fasten bolts which fix Table and housing after adjustment aligning of two pair of housing.

LM shaft and rail installation

Install LM shaft and rail with the Table after mounting of housing to the attachment surface. the parallelization of LM shaft under the stroke should be installed under 0.025㎜ for smooth movement. Following instruction is for LM shaft installation.

1) Place a LM shaft(end supporting or whole supporting)on the floor surface and fasten bolts
2) Fasten bolts to the right position while measuring straightness of aligning shaft with laser, auto collimator or other optical instruments.
3) Put LM shaft on the right place and fasten bolts after fixing the first LM shaft
4) When finishing temporary installation of LM shaft, combine Table and operate in the stroke. parallelize the first and the second LM shaft.
5) In case of whole supporting system, Table should be close to bolting place and fastened with bolts. move a pallet to the end line of LM shaft and fix bolts.
6) Additionally, it is possible to check whether the datum plane of Table's edge is moving in parallel as below. At this moment, the figure of indicator adjoining with the datum plane of Table's edge should not be changed.
Fig 15.
Fig 16.
Fig 17.
Fig 18.

Mounting of open type

Open type(OP) also can be used with clearance adjustable housing as shown on Figure. Light pre-load is applied for normal using, but heavy pre-load should be avoided.

Fig 19. Mounting of Open type
Variation of static load ratings according to installation of Linear Bushing open type

	Orientation of Balls		
No. of Ball Rows	3 row	4 row	5 row

SK - 30
Mounting of LM Aluminum Case Unit

Mounting of SC type Both side mounting of SC(E), SC(E)_W, SC(E)_V type from the top and the bottom side with mounting bolt are both available, and it gives you minimum mounting time.
Fig 21. Mounting of Case Unit

⬤ Application Tips

Mounting of Linear Bushing

For mounting of standard type SAMICK Linear Bushing into the Housing, a jig should be used to avoid direct hitting on the outer sleeve or seal when installing. See below.

D : Housing bore diameter

dr : Shaft diameter
Fig 22. Mounting into housing

Insertion of Shaft

Care must be taken to align the bushing and the shaft when inserting a shaft into a linear bushing.
If the shaft is inserted with slanted, balls may depart from the damaged or deformed retainer.
Fig 23. Insertion of shaft into Linear Bushing

When Moment loads applied

External loads should be distributed uniformly on a Linear Bushing. When moment loads are applied, two or more Linear Bushings should be used on one LM shaft, and the distance between two Linear Bushings should have enough distance. When the moment loads are applied, calculate the equivalent load and choose the proper Linear Bushing.

Mounting of open type Linear Bushing with three ball rows

Please mount the open type Linear Bushings with three ball circuit as same as Figure for considering of load distribution.
Fig 24. Installation example of LM12, LM13

The Rotational Motion Prohibited

Linear Bushing is not suitable for rotational motion, If the Linear Bushing is exposed to rotational motion it may lead unexpected accidents.
Fig 25. The Rotational Motion Prohibited

★1 Dynamic load rating is based on the nominal life of 50km
   In case of 100km, C on the table need to be divided by 1.26
   Ex) 50km basic dynamic load rating(C) of LME12AJ = 410N
      100km basic dynamic load rating(C_{100}) of LME12AJ = 410/1.26 = 325.40N
★2 Based on the weight of resin retainer
★3 Main unit : mm
★4 Outer diameter is the obtained value before the slotting process.
★5 1N ≒ 0.102kgf

LMEFP-L

★1 Dynamic load rating is based on the nominal life of 50㎞
　　In case of 100㎞, C on the table need to be divided by 1.26
　　Ex) 50㎞ basic dynamic load rating(C) of LMEFP12L = 650N
　　　　100㎞ basic dynamic load rating(C₁₀₀) of LMEFP12L = 650/1.26 = 515.87N

★2 Based on the weight of resin retainer

★3 Main unit : ㎜

★4 1N ≒ 0.102kgf

SCW

★1 Dynamic load rating is based on the nominal life of 50㎞
   In case of 100㎞, C on the table need to be divided by 1.26
   Ex) 50㎞ basic dynamic load rating(C) of SC12W = 650N
      100㎞ basic dynamic load rating(C_{100}) of SC12W = 650/1.26 = 515.87N
★2 Based on the weight of resin retainer
★3 Main unit : ㎜
★4 1N ≒ 0.102kgf
★5 Steel retainer applicable from SC8W to SC25W only

★1 Dynamic load rating is based on the nominal life of 50㎞
    In case of 100㎞, C on the table need to be divided by 1.26
    Ex) 50㎞ basic dynamic load rating(C) of SCE12V = 410N
        100㎞ basic dynamic load rating(C₁₀₀) of SCE12V = 410/1.26 = 325.40N
★2 Based on the weight of resin retainer
★3 Main unit : ㎜
★4 1N ≒ 0.102kgf
★5 Steel retainer applicable from SCE8V to SCE25V only

★1 Dynamic load rating is based on the nominal life of 50km
   In case of 100km, C on the table need to be divided by 1.26
   Ex) 50km basic dynamic load rating(C) of SCE12V = 410N
       100km basic dynamic load rating(C₁₀₀) of SCE12V = 410/1.26 = 325.40N
★2 Based on the weight of resin retainer
★3 Main unit : ㎜
★4 1N ≒ 0.102kgf
★5 Steel retainer applicable from SCE8V to SCE25V only

◯ SAMICK Support Rail Unit

SAMICK Support Rail Unit is assembled of Support Rail, LM Shaft, and Open type Linear Bushing Case. All components are standardized for providing interchangeability, and less cost and designing time.

● Part Number Notation

SBS **C** **g6** **30** - **1000** **L**

● SAMICK Support Rail Unit

SBS	Support Rail Unit for SBR
TBS	Support Rail Unit for TBR

● Shaft (by corrosion resistance)

Blank	Standard(SUJ2)
C	Chrome plated shaft
N	Nickel plated shaft
R	Raydent treated shaft

● Shaft tolerance

g6	Asian standard
h6	European standard

● Shaft Diameter

16~50mm

● Shaft Length

100~3000mm

◯ SAMICK LM Shaft

SAMICK supply precision LM shaft for SAMICK Linear Bushing. The hardness, surface finishing, and tolerance of shaft must be considered for choosing the proper shaft because the balls are running directly on the shaft surface. Shaft dimensions are as follows

- Material : High carbon chromium bearing steel
- Hardness : HRC58~64
- Hardened depth : 0.8 ~2.5㎜
- Surface finishing : 0.8S ~ 1.6S
- Straightness : 0.05㎜ / 300㎜

● Part Number Notation

● SAMICK Support Rail Unit

● Shaft (by corrosion resistance)

Blank	Standard(SUJ2)
C	Chrome plated shaft
N[*1]	Nickel plated shaft
R	Raydent treated shaft

● Shaft tolerance

g6	Asian standard
h6	European standard

● Shaft Diameter

5~80mm

● Shaft Length

100~3000mm

★1 under 1m length

LM Shaft special processing

SAMICK also supply specially machined shaft as shown in the below figure. The drilled and tapped holes on LM shaft for mounting on the Support Rail are also available.

<Example>

Drilled or tapped radial hole Drill or Tap at the end of LM shaft Reduced diameter Snap ring groove
Threaded diameters Flats Keyways

SBS
⬤ SAMICK LM shaft support

LM shaft support is a support fixture. the exterior is elegant and compact. The upper part is divided to LM shaft length and it can be fixed strongly by fastening bolts.

● Part Number Notation

deflection
amount
calculation

E : Modulus of Longitudinal elasticity 2.1×10^4(kgf/㎟)

P : Applying Load(kgf)

I : Geometrical Moment of Inertia(㎜⁴) ; $I = \pi d^4/64$, Hollow shaft : $I = \pi(d^4 - di^4)/64$

di : Shaft inner-diameter(㎜), d : Shaft Outer-diameter(㎜)
